Fall 2013

Assignment 0903

This assignment starts up your reading for this course and seeks to get your "developer rig" up and running.

Outcomes

This assignment will affect your proficiency measures for outcomes *4d*, *4e*, and *4f*.

Background Reading

If the course texts are available to you, the following readings will shore up the current material.

- Shneiderman/Plaisant Chapter 1
- Nielsen Chapter 2

For Submission

For this assignment, your "submissions" are the actions you take that will be visible to me.

Free Private GitHub Repository for Students

Acquire a GitHub account then connect to *https://github.com/edu* and request for a student account. This activity is listed first in the assignment because you might need to wait a few days for the GitHub folks to process it—so make your request as soon as possible.

Once you have gotten an account:

- Create a private repository called *cmsi370*
- Add my GitHub account, *dondi*, as a collaborator for that private repository

Git Software Setup

Install *git* on the computer(s) where you will be doing work for this course. There are many ways to install the software, so no single set of instructions can be provided. This GitHub help page can get you going:

https://help.github.com/articles/set-up-git

If you get stuck, ask me.

Sample Code Bazaar

Fork *https://github.com/dondi/bazaar* and clone it to your computer. Show me that you have done this by changing a file, committing it, then sending me a pull request for your changes.
